

ASSIGNMENT-14.4

2303A51303

Shaik Sabina

BATCH-05

Task 1: Responsive Homepage Layout for a Startup Website

Prompt:

Create a responsive homepage layout for a startup website using HTML and CSS.

Requirements:

1. Use semantic HTML structure including:
 - Header with a logo and navigation links (Home, About, Services, Contact)
 - Main content section with a heading, short description, and a call-to-action button
 - Footer with copyright information and contact details
2. Write clean and well-structured HTML code.
3. Generate responsive CSS using media queries so the layout adapts to:
 - Mobile devices (max-width: 600px)
 - Tablets (601px – 1024px)
 - Desktops (above 1024px)
4. Ensure:
 - Navigation becomes stacked or collapsible on small screens
 - Content resizes properly
 - Proper spacing, alignment, and readable typography
5. Keep the design simple and professional using Flexbox or Grid.
6. Provide:
 - Complete HTML code
 - Separate CSS code
 - Comments explaining important sections.

Output:

About Us

We are a small, passionate team on a mission to remove friction from the software development process — so you can focus on what matters: building great products for your users.

HomeAboutServicesContact

Our Services

Everything you need, nothing you don't.

Rapid Prototyping

Go from wireframe to working prototype in hours using our drag-and-drop builder and AI-powered suggestions.

Cloud Infrastructure

Auto-scaling, managed infrastructure that grows with you — from zero to millions of users without re-architecting.

Team Collaboration

Real-time co-editing, review workflows, and role-based access so everyone stays in sync.

Analytics & Insights

Understand how your users interact with your product through clear, actionable dashboards.

Security First

SOC 2 Type II certified, end-to-end encryption, and automatic vulnerability scanning built in.

Integrations

Connect to 300+ tools via our open API and native integrations with the apps your team already loves.

Explanation: In this task, a **responsive homepage** for a startup website is created using **HTML and CSS**. Semantic HTML elements like **header, main, and footer** are used to structure the webpage. The header includes a **logo and navigation links**, the main section contains a **heading, description, and call-to-action button**, and the footer shows **basic information**.

CSS with media queries is used to make the layout responsive for **mobile, tablet, and desktop screens**, ensuring the content adjusts properly and remains readable on all devices.

Task 2: Interactive Call-to-Action Button

Prompt: Extend the responsive homepage layout created in Task 1 by adding an interactive Call-to-Action (CTA) button.

Requirements:

1. Use the same HTML structure from Task 1 (header, navigation menu, main content section, and footer).
2. In the main content section, add a Call-to-Action button labeled "**Get Started**".
3. Write JavaScript that triggers when the button is clicked and displays a visible response to the user, such as an alert message or a message displayed on the page.
4. Ensure the JavaScript:
 - Uses an event listener for the button click

- Does NOT reload the page
 - Is clean and readable
5. Add meaningful comments in the JavaScript explaining:
- How the button is selected
 - How the click event works
 - What the function does when the button is clicked
6. Keep the responsive CSS from Task 1 so the layout still works on:
- Mobile devices (max-width: 600px)
 - Tablets (601px – 1024px)
 - Desktops (above 1024px)
7. Provide the complete updated code including:
- HTML
 - CSS
 - JavaScript
8. Ensure the code is well structured and beginner-friendly.

Explanation: In this task, the responsive homepage created in **Task 1** is extended by adding an **interactive Call-to-Action (CTA) button** labeled “**Get Started.**” JavaScript is used to detect when the user clicks the button and display a **message or alert** as a response.

An **event listener** is added so the action happens without reloading the page. The JavaScript code includes **clear comments** explaining how the button is selected, how the click event works, and what happens when the button is clicked, while keeping the responsive layout from Task 1.

Task 3: Contact Form with Client-Side Validation

Prompt: Extend the responsive homepage created in Task 2 by adding a **Contact Form with client-side validation.**

Requirements:

1. Keep the existing webpage structure from Task 2:
 - Header with navigation
 - Main content section
 - Footer
 - Existing responsive CSS
2. Add a **Contact Form section** in the main content area containing the following fields:
 - Name (text input)
 - Email (email input)
 - Message (textarea)
 - Submit button
3. Use **JavaScript to implement client-side validation** that:
 - Prevents the form from submitting if any field is empty
 - Checks whether the email entered follows a valid email format
 - Prevents page reload when validation fails
4. Display **clear inline error messages** below each field when:
 - The field is empty

- The email format is invalid
5. When all inputs are valid:
 - Display a **success message** such as “Your message has been sent successfully!”
 6. Ensure the JavaScript code:
 - Uses event listeners for form submission
 - Is clean, readable, and beginner-friendly
 - Includes comments explaining the validation logic
 7. Provide the complete updated code including:
 - HTML
 - CSS (if additional styling for error/success messages is needed)
 - JavaScript
 8. Ensure the form remains **responsive for mobile, tablet, and desktop screens**.

Explanation: In this task, a **contact form** is added to the responsive homepage created in **Task 2**. The form includes fields for **Name**, **Email**, and **Message**, along with a **Submit button**.

JavaScript client-side validation is used to ensure that users enter valid information before submitting the form. It checks that **all fields are filled** and that the **email format is valid**. If the input is incorrect, **inline error messages** are displayed. When all inputs are valid, a **success message** is shown without reloading the page.

Task 4: Dynamic List Management for a Product Page

Prompt: Extend the responsive homepage created in Task 3 by adding **Dynamic List Management for a Product Page**.

Requirements:

1. Keep the existing webpage structure from previous tasks:
 - Header with navigation
 - Main content section
 - Contact form
 - Footer
 - Existing responsive CSS
2. Add a new section in the main content area called **Product List**.
3. In this section create:
 - An HTML unordered list () to display product items
 - An **"Add Item"** button
 - A **"Remove Item"** button
4. Use **JavaScript to dynamically manage the list** so that:
 - Clicking **Add Item** adds a new list item to the product list
 - Clicking **Remove Item** removes the **last item** from the list
 - The page does **not reload**
5. Ensure the DOM updates immediately when items are added or removed.
6. Write **clean and beginner-friendly JavaScript** that:
 - Uses event listeners for button clicks
 - Clearly selects DOM elements
 - Includes comments explaining the logic

7. Provide the **complete updated code including:**

- HTML
- CSS (only if extra styling for the list is needed)
- JavaScript

8. Ensure the page remains **responsive for mobile, tablet, and desktop screens.**

Output:

Explanation: In this task, a **Product List section** is added to the responsive webpage created in **Task 3**. An HTML list is used to display product items along with “**Add Item**” and “**Remove Item**” buttons.

JavaScript DOM manipulation is used to dynamically add a new item to the list or remove the last item when the buttons are clicked. The list updates **instantly without reloading the page**, and the code is written in a **clear and maintainable way**.

Task 5: Modal Popup for User Notifications

Prompt: Extend the responsive homepage created in Task 4 by adding a **Modal Popup for User Notifications**.

Requirements:

1. Keep the existing webpage structure from previous tasks:
 - Header with navigation
 - Main content section
 - Product List section
 - Contact Form
 - Footer
 - Existing responsive CSS

2. Add a button labeled "**Open Modal**" somewhere in the main content section.
3. Generate the **HTML structure for a modal popup** that includes:
 - A modal container
 - A semi-transparent background overlay
 - A modal content box with a short notification message
 - A **Close (×) button**
4. Create **CSS styling** that:
 - Centers the modal on the screen
 - Uses a **semi-transparent dark overlay** behind the modal
 - Clearly separates the popup from the page content
 - Keeps the design simple and responsive
5. Use **JavaScript to control the modal behavior**:
 - Clicking **Open Modal** displays the popup
 - Clicking the **Close button (×)** closes the popup
 - Clicking **outside the modal (overlay)** also closes the popup
6. Ensure the JavaScript:
 - Uses event listeners
 - Updates the DOM dynamically without reloading the page
 - Includes clear comments explaining the logic
7. Provide the **complete updated code including**:
 - HTML
 - CSS
 - JavaScript
8. Ensure the modal popup and page layout remain **responsive for mobile, tablet, and desktop screens**.

Explanation: In this task, a **modal popup notification** is added to the responsive webpage created in **Task 4**. A button labeled “**Open Modal**” is used to display the popup. The modal includes a **message, a close (×) button, and a semi-transparent overlay background**.

CSS is used to style and center the modal, while **JavaScript** controls opening and closing the popup. The modal can be closed by clicking the **close button or the overlay**, and it appears **without reloading the page** while keeping the layout responsive.
